

# Application Development

*Move your App to Market Sooner  
and Ramp Up Profit*

## Application development

Application development projects can be difficult to manage, while ensuring milestones and retaining hard-won ROI. Quest can handle the details with our flexible development strategies. From an Agile approach to the traditional Application Life Cycle Management, Quest has a team that can meet your specific needs.

## Assessment and Validation

Working with your team, our business and development consultants ask the important questions to understand your needs quickly and to effectively scope and document your high-level solution.

## Concept/Design

With the information gleaned from the discovery phase, our engineers create a development design document and estimate which includes timelines, deliverables and cost estimates; armed with the facts to ensure accurate deliverables.

## Development Agility

The application is developed, tested, released and documented. User and development team documentation options are available depending on application targets or verticals. You have every opportunity to review your application and provide feedback. Quest has the proven agility to align to business changes real-time.

## Testing & QA

Applications are deployed into a beta environment and application user testing, load testing & quality assurance processes are performed. Our staff works with you to review and finalize your documentation while preparing your application deployment and provide you with application testing results.

## Production/Launch

Whether the application is deployed in one of our many data centers, at your site, or released through another channel, your application is launched for client use. We will complete any final testing and assure stability at this stage.

## Maintenance and Support

Quest can design a dynamic and comprehensive solution to handle the maintenance and support of your application, whether you want to handle it yourself, or would rather not be involved at all. Quest will work with your specific needs.

## Application Security

The majority of developers are not security experts, and secure coding is historically not identified as a priority. Oftentimes, the arduous task of vulnerability identification and remediation cannot be successfully addressed by limited IT security resources. Quest offers a time-saving solution for all types of security testing - outsourced individual, and enterprise-wide analysis - and for all types of users - application developers, build managers, quality assurance (QA) teams, penetration testers, security auditors and senior management.

## Virtual Bench

Quest's Virtual Bench covers almost every development technology. Tell us more about your needs and we will offer customized team solutions that can carry you through the entire development lifecycle or through simple staff augmentation.

## Global Reach with Local Support

With tested, proven and successful off- and near-shore development reach, our partners in North and South America and Asia can save you money on development costs and offer an ROI hedge during development lifecycles – a valuable option in today's business environment. Our on-shore resources are comprehensive, with hybrid teams and US-based project managers, so communication and requirements are handled without complication.

## Mobile Development Expertise

From concept to development, Quest can take your business to the next level strategically designing applications for any of your mobile devices; your phones, tablets, and other personal or enterprise digital assistants. With Quest's in-depth experience, you will achieve optimum performance and universal usability while bringing your apps to market fast!

**Your Go-to Partner for Application Development**
