

# Are you nearing a technology end-of-life?

*Eliminate the guesswork: identify vulnerabilities, configuration errors, and critical software updates with Quest's EOL Check*

New and improved updates are inevitable – even when it feels like the last update just occurred. Vendors must intermittently limit or entirely eliminate support for particular versions of their products. But a machine or software's end-of-life doesn't have to disrupt business. Whether your organization is facing an end-of-life (EOL) or striving to rectify its environment's configuration issues and

vulnerabilities, Quest can help identify opportunities for improvement and provide a roadmap to solutions.

Quest's End-of-Life Check is a non-invasive yet effective way to discover security vulnerabilities and missing upgrades, poor configuration practices, and unmet compliance regulations. It's a proactive step to monitoring a constantly changing server environment.

With Quest's EOL Check, you will be able to identify problems and pitfalls in a simple and straightforward way. Once you understand your organization's potential susceptibility, you'll be prepared to efficiently accommodate an end-of-life transition before the clock runs out.

What does the EOL Check entail?

#### Introductory call

- Identify goals, determine the assessment targets on which you'd like Quest to focus, and schedule your EOL Check

#### The check

- Remotely executed scan assesses internal/external servers, depending on your organization's needs

#### Review results

- Quest provides a comprehensive review of the results and discusses next steps

#### Q&A

- Address questions or concerns about the assessment or findings

You don't have to face it alone. We can help.
